BLOCKSTREET

Product Decisions Log

This document traces the product thinking and decision rationale for the Blockstreet launchpad, extracted from team calls between January 26 and March 24, 2026. It answers the question: what was decided, why, and how did the thinking evolve.

This is the companion document to the Launchpad Redesign Specification. The spec defines what to build; this document explains why.

Date: March 30, 2026

For: Sagar, Kyle K, Rachael, David, and development team

1. Decision timeline

Chronological view of how the product evolved across six calls. Key inflection points are highlighted.

Date	Milestone	Key decisions
Jan 26	**Initial allocation model**	Target raise $500K. Tiers simplified to qualified/not-qualified. Lock periods 30/90/180/365d. Three-stage allocation plan. Stablecoin raises confirmed.
Jan 29	**VIP (open) + fee structure**	VIP deposits 3d pre-sale. 7.5% stablecoin fee + 5% token allocation. KYC mandatory, KYB for projects. Embedded + external wallets via Privy. 1–2 quality projects/month.
Mar 12	**Dev readiness check**	Lottery code incomplete. Audit scope small (code removals). Community waiting. Legal questions unresolved.
Mar 19	**Allocation model v2**	Top-500 leaderboard + FCFS pool (80/20 split). Positive multipliers only (no penalties). Primary wallet designation. Social mining separate from on-chain analysis.
Mar 24	**Model finalized**	Dynamic inputs replace hard-coded values. 180d median stake assumed. 60%/3x multiplier = $1.8M oversubscription. Wallet quality + social multipliers deferred.
Late Mar	**Implementation started**	50% functional. Phase 1/2 structure confirmed. Phase 2 can repeat. Incomplete features hidden. Solana integration top priority.

2. Allocation model decisions

This is the most iterated area. The model went through three major versions across the calls.

2a. Tier removal and simplification

D-01	**Remove multi-tier system, replace with qualified / not-qualified**
Rationale	Kyle C pushed for simplification. Multiple tiers created allocation complexity and oversubscription edge cases. A single qualification threshold (minimum stake) with a leaderboard-based ranking within the qualified group achieves the same result with less confusion. Oversubscription triggers internal ranking, not visible tiers.
Source	Jan 26 call (23:32), confirmed Mar 19 (00:22)
Status	**Confirmed**

D-02	**Top-500 leaderboard for guaranteed allocation, remainder enters FCFS pool**
Rationale	Kyle C and David 10X landed on a hybrid: the top N users by points get guaranteed allocation slots, everyone else competes in a first-come-first-serve pool (~20% of total). This balances rewarding committed stakers with keeping the platform accessible to smaller holders. The cutoff number (500) is configurable per launch.
Source	Mar 19 call (00:22), refined from Jan 26 three-stage model
Status	**Confirmed**

D-03	**Three-stage allocation release: 24h guaranteed → 24h FCFS (stakers) → open to all KYC**
Rationale	Originally proposed Jan 26. Stage 1: qualified users with minimum stake get 24h to commit. Stage 2: remaining allocation opens FCFS to all stakers. Stage 3: any leftover opens to all KYC-verified users regardless of holdings. Stage 3 is expected to be rare in hot markets.
Source	Jan 26 call (34:33)
Status	**Confirmed**

D-04	**VIP investors must commit deposits 3 days before public sale**
Rationale	Kyle C insisted on 100% deposit commitment (not David's suggested 20%). Rationale: knowing exact VIP participation 3 days out lets the team reallocate unused VIP funds to the public round cleanly, preventing over-allocation and enabling tighter liquidity control. Also prevents early large sell-offs that hurt token price.
Source	Jan 29 call (17:10)
Status	**Confirmed**

2b. Lock periods and multipliers

D-05	**Lock periods: 30, 90, 180, 365 days. Multipliers: 1x, 2x–3x, 5x, 10x**
Rationale	Kyle C and Matheus iterated on these across Jan 26 and Mar 24. The 180-day median assumption reflects realistic user behavior from past launchpad cycles. Multipliers intentionally scale exponentially to heavily incentivize the 365d lock. Minimum lock for participation is 30d, but meaningful multipliers start at 90d. Note: the 30d/1x tier was later discussed as potentially being raised to a higher minimum stake to control supply (most recent call).
Source	Jan 26 (09:21), refined Mar 24 (01:44), minimum raised in most recent call
Status	**Confirmed**

D-06	**Positive multipliers only — no penalties for selling or negative behavior**
Rationale	Kyle C and David 10X explicitly rejected negative multipliers/penalties. Rationale: penalizing users for selling tokens they bought legitimately is bad optics, resembles “meme token” mechanics, and creates complexity. Instead, wallet analysis identifies positive behaviors (DeFi usage, holding patterns) and rewards them. Early unstaking incurs a penalty (acceptable), but normal trading does not.
Source	Mar 19 call (00:05), reinforced by Jan 29 no-buy/sell-tax decision (42:17)
Status	**Confirmed**

D-07	**Wallet quality, social engagement, and sector fit multipliers deferred to post-V1**
Rationale	These were in the original model (Jan 26, Mar 24) but the most recent call explicitly decided to hide them from the UI until functional. Kyle C: “Don’t show these features until fully functional.” This avoids user confusion and sets clear expectations. The allocation model remains robust with zero soft multipliers.
Source	Most recent call (00:08), echoes Mar 24 model stability note (01:44)
Status	**Confirmed — deferred**

D-08	**All model variables must be dynamic, never hard-coded**
Rationale	Kyle C stressed this after prior incidents where hard-coded values caused system failures when inputs changed. Matheus and Sagar must coordinate which inputs remain dynamic. This is a technical architecture decision with direct UX implications: the UI must read from configurable parameters, not static values.
Source	Mar 24 call (11:29)
Status	**Confirmed**

3. Fee structure and economics

D-09	**Platform fee: 7.5% stablecoin + 5% token allocation per project**
Rationale	The 7.5% stablecoin fee is industry-standard (intentionally set slightly lower to build initial adoption, with room to increase as brand strengthens). The 5% token allocation is negotiated per project and covers incubation services: marketing support, liquidity provision, KOL connections. Token allocation contributes to liquidity pools. Unlock schedules are case-by-case.
Source	Jan 29 call (22:21–25:03)
Status	**Confirmed**

D-10	**Projects raise in stablecoins (USDT/USDC), not BLOCK tokens**
Rationale	Kyle C emphasized this to avoid treasury volatility risk. BLOCK is for staking to qualify for allocations, not the investment currency itself. This simplifies treasury management and matches best practices from project founders. Clean separation: BLOCK = access token, stablecoin = investment currency.
Source	Jan 26 call (40:46)
Status	**Confirmed**

D-11	**No buy/sell tax on BLOCK token**
Rationale	Team unanimously rejected transaction taxes. Kyle C: these resemble “meme token” mechanics and damage market confidence. Penalties focus only on early unstaking (breaking lock commitment), not normal trading activity.
Source	Jan 26 call (42:17)
Status	**Confirmed**

4. Phase structure and pool logic

D-12	**Two-phase model: Phase 1 (ranked/priority) + Phase 2 (FCFS). No Phase 3.**
Rationale	Confirmed in most recent call. Phase 1 = location-based (ranked) allocations. Phase 2 = first-come-first-serve for remaining capacity. Phase 2 can repeat recursively if needed, effectively creating multiple FCFS rounds without a formal Phase 3. This simplifies the rollout while maintaining flexibility.
Source	Most recent call (00:07)
Status	**Confirmed**

D-13	**Scheduled pools show Notify/Waitlist only — no invest CTA, no capital lock pre-launch**
Rationale	Design decision from product audit. Rationale: showing an invest CTA on a pool that isn't open yet creates false commitment signals and complicates the refund flow if users change their minds. Notify me / Join waitlist is the correct pre-launch pattern.
Source	Product design audit (confirmed logic from Jan 29 soft cap refund discussion)
Status	**Confirmed**

D-14	**Sold-out state branches: invested vs. missed, with chain-aware DEX CTA**
Rationale	If a user invested: show position details, TGE info, pending claim. If they missed: show external trading link that automatically changes based on project chain (Solana = Meteora, EVM = PancakeSwap/Uniswap). No dead-end "sold out" screen.
Source	Product design audit, consistent with Jan 29 platform features discussion (18:26)
Status	**Confirmed**

D-15	**Failed pools: auto-refund to participation wallet**
Rationale	If a pool ends below soft cap, refund is automatic to the wallet used for investment. No manual process. This was explicitly called out in Jan 29 (16:13) as critical for user trust. The UI must show refund status clearly.
Source	Jan 29 call (16:13)
Status	**Confirmed**

5. Compliance and identity

D-16	**KYC mandatory for all investors, KYB mandatory for all projects**
Rationale	Third-party KYC provider (TBD). Users must verify before participating. Dashboard shows clear KYC status warnings. Global participation except sanctioned regions. US residents are not restricted despite gray regulatory zone. Manual KYB for projects is acceptable given low expected volume (1–2/month).
Source	Jan 29 call (34:24–37:05)
Status	**Confirmed**

D-17	**Smart contract ownership: legal review needed**
Rationale	Open question from Jan 29. Should Blockstreet own the smart contracts, or the projects themselves? Affects centralization and compliance posture. Legal counsel (Rick Levin) has not responded as of Mar 12. This remains a blocker for final contract architecture.
Source	Jan 29 call (27:47), flagged as unresolved Mar 12 (04:10)
Status	**Open — blocked on legal**

6. Wallet model and multi-chain

D-18	**Embedded wallets (Privy) for new users + external wallets for experienced users**
Rationale	New users get a Privy-created wallet with Moonpay integration for buying stablecoins. Experienced users connect their own self-custody wallets directly, avoiding the need to deposit into a platform wallet. Users can link multiple wallets to one account for aggregated portfolio views. This dual approach minimizes friction for both audiences.
Source	Jan 29 call (26:42–31:32)
Status	**Confirmed**

D-19	**Primary wallet designation for allocation and analysis**
Rationale	Users may stake with multiple wallets, but only the primary wallet's on-chain behavior counts toward rewards and allocation calculations. This prevents gaming via wallet splitting. Social accounts link to user profiles (not wallets) for engagement tracking. KYC ties the identity together.
Source	Mar 19 call (00:12)
Status	**Confirmed**

D-20	**Solana integration is top priority for V1**
Rationale	Most recent call confirmed Solana unification with the EVM launchpad is the highest chain priority. L2 Ethereum chains are mostly done. Future chains (Sui) are planned but lower priority. The Solana-side code changes mostly remove features rather than add them, which reduces audit complexity.
Source	Most recent call, Mar 12 call (10:25)
Status	**Confirmed**

D-21	**Solana launchpad defaults should match EVM setups for consistency**
Rationale	Kyle C emphasized matching proven logic between chains and avoiding "meme launchpad pitfalls." The product should feel like one launchpad with multi-chain support, not two separate products.
Source	Jan 29 call (22:06)
Status	**Confirmed**

7. Project selection and curation

D-22	**Target 1–2 high-quality projects per month**
Rationale	Kyle C: quality over quantity. The platform builds reputation through strong returns, not volume. Avoiding speculative ventures and “meme launchpad” positioning. This informs the founder onboarding workflow: manual KYB is acceptable because volume is low and intentional.
Source	Jan 29 call (30:26)
Status	**Confirmed**

D-23	**Future: project owners can customize wallet analyzer weighting per pool**
Rationale	Projects would be able to specify which user attributes their pool prioritizes (e.g., DeFi activity vs. NFT collecting vs. holding patterns). This is a post-V1 feature but was flagged in the most recent call as needing a roadmap slot. It differentiates Blockstreet from generic launchpads.
Source	Most recent call (13:00), related to Mar 19 multiplier discussion
Status	**Deferred — post-V1**

8. Platform features and UX decisions

D-24	**No embedded DEX — external trading links only**
Rationale	The team debated building a DEX interface but decided against it for V1. External links (Uniswap, Meteora, PancakeSwap) are sufficient. The chain-aware CTA on sold-out pools handles this cleanly.
Source	Jan 29 call (18:26)
Status	**Confirmed for V1**

D-25	**Lottery feature: undefined, code incomplete**
Rationale	As of Mar 12, the lottery mechanism targets smaller holders without guaranteed allocations. Code exists only partially and is not connected at the app level. This needs further discussion and math justification before implementation. Not a V1 blocker but needs roadmap clarity.
Source	Mar 12 call (07:16)
Status	**Open**

D-26	**Gift/fractionalize feature: NFT investment shares via email**
Rationale	Discussed in Jan 29 as a viral growth mechanism. Users could fractionalize and send investment shares as NFTs. Interesting but clearly post-V1. Not blocked on any other decision.
Source	Jan 29 call (37:38)
Status	**Deferred — post-V1**

D-27	**Mobile app: iOS approval 1–4 days once submitted**
Rationale	Jan 29 noted lack of in-house mobile expertise requiring external resources. Mar 12 confirmed a mobile developer is being onboarded.
Source	Jan 29 (58:21), Mar 12 (10:25)
Status	**In progress**

D-28	**Social XP / social mining as separate engagement system**
Rationale	On-chain wallet analysis and social engagement are treated as two distinct reward streams. Social mining tracks promotional activity and community interaction, tied to centralized user accounts (not wallets). This circumvents multiple-wallet gaming. Confirmed as a future feature, not V1.
Source	Mar 19 call (00:05), deferred in most recent call (00:08)
Status	**Deferred — post-V1**

9. Unresolved items requiring decisions

These items were raised across calls but never fully resolved. They need stakeholder input before design and development can finalize.

#	Question	First raised	Blocker for
O-1	Points → max allocation formula	Jan 26	Dashboard access module, allocation display
O-2	Show estimated allocation pre-launch?	Design audit	Scheduled pool card content
O-3	V1 chain scope (EVM + Solana + L2s? Which L2s?)	Jan 29 / Design audit	Wallet module, pool config
O-4	TGE/vesting detail visibility pre-investment	Design audit	Pool detail page depth
O-5	Founder: self-serve vs review-controlled?	Design audit	Submission flow UX
O-6	Smart contract ownership (Blockstreet vs project)	Jan 29	Legal compliance, contract arch
O-7	Legal review on US participation	Jan 29	Compliance, geo-blocking

10. How to use this document

This decisions log is a living document. As open items are resolved, they should move into the confirmed decisions sections with their rationale recorded.

For developers

Each decision entry includes the source call and rationale. If you encounter ambiguity during implementation, check the decision ID against this document first. If the answer isn't here, it's likely in the Open Items table and needs a stakeholder call.

For product/design

The Launchpad Redesign Specification is the implementation reference. This document is the "why" behind those specs. Cross-reference decision IDs when reviewing design work.

For stakeholders

The Open Items table (Section 9) lists everything that needs your input. Each item shows what it blocks. Resolving these unblocks specific design and development work.

End of document. 28 confirmed decisions, 10 open items, sourced from 6 team calls.
